

Inuua Tujenge - Frontend Developer Evaluation Task

This is a small programming exercise to help us evaluate your technical competency with the tools that you would be working with at Inuua.

We would suggest you spend no more than 90 minutes on this task

Task Description

The attached file is part of the new Inuua website design showing how the new plan detail view would look.

Using any frontend technologies at your disposal, create a simple web page to implement the design as shown. Do not bother with making it clickable/functional. This is purely a test of UI development capability. Please ensure the page works well on mobile devices(as designed). It's not necessary to do the same for larger screens.

In the attachment there is a PNG file(*Designed UI for Implementation.png*) of the design and plan image used(*plan_image.jpg*). The font used is Gilroy, but any similar sans serif font will do. For icons, feel free to use those available to you from your favorite icon packs or projects such as Font awesome. If the exact icon can't be found, use the closest one you can find, don't sweat it.

Only thing we ask is that your code should be well structured, clean, functional and easy to extend.

Submission

Please put your work in a public Github/Gitlab/Bitbucket repository and share a link with us by Thursday 9th July (before the next interview on Friday 10th July). We will review this with you at our next interview and will also ask you to make some modifications to the code during the interview.
